HTML FORMS

Question 1: What are HTML forms used for? Describe the purpose of the input, textarea, select, and button elements.

Answer : Forms help people send information to a website. Input is for typing small data, textarea is for big text, select gives options in a list, and button is for sending the form or taking action.

Question 2: Explain the difference between the GET and POST methods in form submission. When should each be used?

Answer: GET is like writing your request on a postcard everyone can see it. Best for simple, non-secret info. POST is like putting your request in an envelope hidden from others. Best for secret or big data.

Question 3: What is the purpose of the label element in a form, and how does it improve accessibility?

Answer: Label acts like a tag that tells people what the box is for (like 'Name', 'Email'). It makes forms easier to understand and lets disabled users or those using assistive tools fill forms easily.
